1 · OVERVIEW

Executive Summary

Independent workers — freelancers, gig workers, cooperatives, and autonomous organizations — are the fastest-growing segment of the global labor market. They are chronically underserved by software built for corporate employees.

Kogi is a unified operating system designed specifically for independent workers. Where others use a patchwork of disconnected apps — one for projects, one for invoicing, one for clients, one for their community — Kogi provides a single, deeply integrated platform that manages their entire professional and economic life.

This document defines the problem Kogi solves, who it solves it for, the size of the opportunity, and the specific product requirements that translate user needs into platform capabilities.

Pillar	What Kogi Does	Why It Matters
Unified Portfolio	One place to manage all projects, assets, investments, and goals	Independent workers average 4–7 concurrent engagements; tracking them across apps creates cognitive overload and missed opportunities
Integrated Exchange	End-to-end payments, escrow, equity, and cooperative economics in one system	Freelancers lose 15–25% of project time to invoicing, payment chasing, and financial admin across fragmented tools
Democratic Capital	Built-in crowdfunding, capital pools, and cooperative ownership structures	Cooperative and collective business models are growing but have no software infrastructure purpose-built for them
AI-Augmented Work	An AI agent that understands your entire portfolio and works with you across every module	AI assistance today is surface-level; deeply contextual AI that understands your business holistically is a step-change
Worker-Owned Community	A social and collaboration layer governed by and for independent workers	Professional networks exist for employers and employees; independent workers lack a platform that represents their interests

2 · PROBLEM

Problem Statement

2.1 The Core Problem

"Independent workers run businesses as complex as small enterprises, with the tools of a part-time hobbyist."

The independent workforce — freelancers, gig workers, solopreneurs, cooperative members, and contributors to open-source or collective organizations — manages a professional life of enormous complexity. They juggle clients, projects, personal goals, financial planning, community relationships, and long-term asset building simultaneously. Yet the software ecosystem they rely on was never designed for them.

Independent workers inherit tools designed for corporations (Jira, Salesforce, Workday), tools designed for mass-market consumers (Google Docs, Notion, Venmo), and tools designed to extract maximum value from their labor (Upwork, Fiverr, Uber). None of these tools are designed to serve independent workers' own interests, and none of them work together.

2.2 Problem Decomposition

Problem Domain	Specific Pain Point	Current Workaround	Cost of Workaround
Portfolio Fragmentation	Work, personal goals, assets, and investments exist in different apps with no unified view of progress or health	Manual spreadsheets, Notion dashboards, or simply no tracking	1–3 hours/week of manual updating; strategic decisions made without full context
Financial Complexity	Invoicing, escrow, equity, barter, revenue share, cooperative distributions — each requires a different tool or manual process	Stripe + QuickBooks + PayPal + manual spreadsheets + lawyer-drafted contracts	15–25% of billable time; late payments common; equity tracking non-existent for most
Cooperative Blindspot	Worker-owned businesses, investment clubs, and collective organizations have no software infrastructure for their governance and economics	Paper bylaws + email votes + bank accounts + manual equity spreadsheets	Decision latency of days to weeks; disputes due to unclear records; cap table errors
AI Assistance Mismatch	AI tools today are general-purpose chat assistants; they have no knowledge of your	Copy-paste context into ChatGPT for each query; results are generic and low-quality	Time lost; low trust in AI output; missed opportunities for proactive automation

Problem Domain	Specific Pain Point	Current Workaround	Cost of Workaround
	portfolio, clients, projects, or goals		
Community Isolation	Independent workers lack a professional community platform that understands and serves their specific context	LinkedIn (employer-centric), Discord (generic), Reddit (anonymous)	Career development stunted; collaboration and co-selling rare; network effects captured by platforms, not workers
Work Execution Gap	Freelancers manage complex client work without the project management infrastructure of corporate teams	Asana + Trello + Slack + Google Docs, none integrated with invoicing or portfolio	Context switching; client confusion; delivery quality inconsistency
Capital Access Deficit	Independent workers and cooperatives cannot raise capital through structures appropriate to their ownership model	Traditional VC (wrong model), crowdfunding platforms (general, not integrated with their work system)	Undercapitalized ventures; extractive equity terms; platform dependency

2.3 Why Now

- The independent workforce has grown to 1.57 billion workers globally and is projected to represent 50%+ of the US workforce by 2027.
- AI capability has reached the threshold where a deeply contextual, portfolio-aware AI agent is technically feasible and genuinely useful — not a toy.
- Worker cooperative and collective ownership models are growing rapidly, driven by platform backlash and pandemic-era economic disruption.
- The next generation of platform infrastructure (WebSockets at scale, modern auth, vector databases for AI) has matured enough to build the unified platform at reasonable cost.
- No incumbent has established a dominant position in the "independent worker OS" category — the space is contested between point solutions, none of which are integrated.

> ⚠️ **The Critical Gap**
>
> - The closest existing platform to Kogi's vision is a hypothetical combination of Notion + Stripe + GitHub + Upwork + Discord + Gnosis Safe. This combination requires 5+ subscriptions, 5+ context switches per day, and produces zero shared data between systems. Kogi replaces this entire stack with a single unified, AI-augmented platform where every module shares a common data model.

3 · MARKET

Market Opportunity & Sizing

3.1 Total Addressable Market

Market Segment	Global Population	Relevant Subset	TAM (Annual SaaS + Transaction)
Freelancers & Independent Contractors	1.57B globally	Tech-enabled, earning >$15k/yr: ~120M	$48B — $400/yr SaaS × 120M
Gig Economy Workers (platform-based)	750M globally	Gig workers seeking cooperative/worker-owned alternatives: ~50M	$10B — $200/yr SaaS × 50M
Small Business Owners (solo/micro)	582M globally	Digital-first micro businesses: ~80M	$48B — $600/yr SaaS × 80M
Worker Cooperatives & Collectives	~3M organizations globally	Tech-enabled, 5–500 members each: ~500K orgs	$3B — $600/yr per org × 500K
Open Source / AO Contributors	~100M GitHub users	Active contributors seeking work infrastructure: ~15M	$3B — $200/yr × 15M

Market Level	Annual Revenue Opportunity	Notes
Total Addressable Market (TAM)	$112B+	All independent workers globally, across all segments
Serviceable Addressable Market (SAM)	$28B	English-language, digital-first workers in North America, EU, Australia/NZ, and India
Serviceable Obtainable Market (SOM) — Y1–3	$560M	2% penetration of SAM; 1.4M paying users at $400/yr ARPU
SOM — Y4–6	$2.8B	10% SAM penetration; 7M users at $400/yr ARPU + 3% transaction revenue on $40B GMV

3.2 Revenue Model

Revenue Stream	Description	Target Mix (Y3)
Subscription — Free	Personal portfolio, basic WBS, limited AI credits. Freemium acquisition driver.	0% direct; acquisition cost offset
Subscription — Starter ($15/mo)	Full portfolio, WBS, Studio, Market access, standard AI credits.	20% of revenue
Subscription — Pro ($35/mo)	All modules, advanced AI, Market seller, Exchange, unlimited automation.	35% of revenue
Subscription — Team ($80/mo per team)	Pro for up to 10 members, shared workspace, governance tools.	20% of revenue
Transaction Fees — Market	2.5% platform fee on all market transactions (service, gig, product orders).	15% of revenue
Transaction Fees — Exchange	1% fee on escrow releases, 0.5% on cooperative distributions.	8% of revenue
Enterprise & Cooperative	Custom pricing for AOs with 100+ members, SLA, dedicated support, data residency.	2% of revenue (growing)

3.3 Market Timing Rationale

Three macro forces are converging to create the ideal conditions for Kogi's launch window:

Force	Evidence	Kogi Opportunity
Platform Backlash	Uber, Lyft, Upwork, and Fiverr have all faced significant worker backlash over fee increases, algorithm opacity, and worker classification. Worker cooperative models have grown 40% since 2019.	Kogi's cooperative-first architecture and worker-owned community model directly addresses this backlash.
AI Inflection Point	LLM capability crossed a threshold in 2023 where contextual AI assistance is genuinely useful (not a toy). Cost per token has dropped 90% in 18 months.	Deep portfolio-aware AI is now possible at a cost that fits inside a $35/mo subscription.
Remote Work Normalization	Remote work has normalized independent contracting across industries that previously required physical presence. 40% of knowledge workers now work independently some of the time.	Dramatically expands the TAM and makes digital-first work infrastructure essential rather than optional.

4 · PERSONAS

Target Users & Personas

P1 Jordan Chen

Independent Technology Consultant

Background

34 years old, based in Austin TX. 8 years corporate experience, 4 years independent. Annual revenue: $240K across 4 concurrent client engagements. Manages a growing portfolio of consulting work, a SaaS product side project, a real estate investment, and a personal development program.

Pain Points

- Juggling 4 clients in 4 different project management systems (clients use Jira, Asana, Monday, Trello)
- Invoice tracking across 4 clients in QuickBooks; 2–3 payments always overdue
- No single view of total business health — how profitable is the SaaS side project vs consulting?
- AI tools don't know anything about my business; every query requires copy-pasting context

Desired Outcomes

- Unified workspace where all 4 clients' work is visible in one place
- Single invoicing and payment system that works regardless of how clients pay
- AI assistant that actually knows my portfolio and can answer "which client is most profitable?"
- A community of consultants I can refer work to and get referrals from

Expected Plan & Modules

Plan: Pro ($35/mo) → Team (as business grows)

Primary Modules: Market (seller), Exchange, WBS, Portfolio, AI Agent, Community

P2 Maria Santos

Worker Cooperative Co-Founder

Background

41 years old, based in São Paulo, Brazil. Co-founder and member of a 35-person delivery worker cooperative. The cooperative is worker-owned, democratically governed, and currently manages logistics for local restaurants. Annual collective revenue: $1.2M, distributed among members.

Pain Points

- No software exists that handles cooperative governance AND financial distributions AND member task assignment in one place
- Proposal voting happens via WhatsApp messages; records are informal and disputed

- Member earnings calculations done manually in spreadsheets — error-prone and opaque
- Cannot raise capital through equity campaigns because the paperwork and infrastructure don't exist for cooperatives

Desired Outcomes

- One platform that handles governance (proposals, voting), payroll distributions, work assignment, and capital management
- Transparent, immutable records that all members can audit
- Ability to raise a membership-based campaign to fund a new fleet of vehicles
- AI that helps write governance proposals and calculates fair distributions

Expected Plan & Modules

Plan: Team/Cooperative ($80/mo for org)

Primary Modules: AO Governance, Exchange (distributions), Crowdfunding, Market, WBS, Community

P3 Devon Park

Gig Worker & Side Project Builder

Background

26 years old, based in Seoul, South Korea. Full-time delivery gig worker (3 platforms), building a food photography side business. Income: $32K/yr gig + $8K/yr side business. Dreams of replacing gig work with the photography business in 2 years.

Pain Points

- No visibility into whether the photography business is actually growing or stagnating
- Gig income is volatile; hard to plan or save when income arrives across 3 apps
- Photography clients pay via Kakao Pay, bank transfer, and sometimes late — no system
- The business idea ("Korean street food photography agency") is in his head, not documented anywhere

Desired Outcomes

- A roadmap that shows the path from gig worker to full photography business owner
- Simple invoicing that works for informal Korean clients
- A place to capture and develop the business idea into a real plan with AI help
- Community of other side-project builders going through the same transition

Expected Plan & Modules

Plan: Free → Starter ($15/mo)

Primary Modules: Portfolio, Studio, Exchange, Market (seller), Community, WBS

P4 Priya Nair

Collective Investment Club Organizer

Background

47 years old, based in London, UK. Organizes a 22-member real estate investment club that pools capital to acquire and manage rental properties. Club treasury: $340K. Annual distributions: ~$28K split across members based on equity stake.

Pain Points

- Capital pool tracking done in a shared Google Sheet; three members don't trust it
- Voting on new property acquisitions via email threads — quorum is unclear, records incomplete
- Distribution calculations are done by Priya manually, creates resentment and accusations of favoritism
- No formal equity cap table; member stakes recorded informally

Desired Outcomes

- A capital pool with immutable transaction history that all members can see
- Formal proposal and voting system with quorum enforcement and outcome recording
- Automated, transparent distribution calculations that nobody can dispute
- A proper cap table showing each member's stake, contribution history, and returns

Expected Plan & Modules

Plan: Team/Cooperative ($80/mo for org)

Primary Modules: AO Governance, Exchange (capital pool + distributions), Crowdfunding, Portfolio

5 · RESEARCH

User Research Insights

5.1 Key Research Findings

The following insights are synthesized from independent worker survey data, market research, and qualitative interview patterns observed across the independent worker segment.

Finding	Data Point	Product Implication
Tool Fragmentation is Universal	Average independent worker uses 7.3 digital tools for their professional life. 84% report that switching between tools is a daily source of frustration.	Unified workspace with cross-module navigation is table-stakes, not a differentiator.
Financial Admin is the Biggest Time Sink	Independent workers spend an average of 8.3 hours/week on financial administration: invoicing, payment chasing, tax prep, and expense tracking.	Exchange module + AI automation must demonstrably reduce financial admin time. This is our strongest near-term value proposition.
AI Adoption is High but Trust is Low	72% of independent workers use AI tools weekly, but only 31% trust AI output enough to use it without heavy verification.	AI Agent must be transparent (show sources and reasoning), conservative (ask before acting), and demonstrably contextual. Trust is built through accuracy, not impressive demos.
Cooperative Interest is Growing but Tooling Prevents Adoption	61% of independent workers have "seriously considered" working as part of a cooperative or collective structure. 82% of those cite "lack of software tools" as the primary barrier.	AO and Cooperative modules are a differentiated market expansion opportunity with strong latent demand. Build them right; market them separately.
Community Matters More Than Expected	When asked to rank feature categories by importance, "professional community" ranked 2nd (behind payments, above project management) among workers with 3+ years of independence.	Community module is not a nice-to-have. It is a core retention driver and network-effect flywheel.
Mobile is Critical for Gig Workers, Optional for Consultants	Gig workers (P3 persona) primarily use mobile for work. Consultants (P1 persona) primarily use desktop/web.	Invest in mobile PWA before native app. Web client must be mobile-responsive on day one.
Onboarding Friction is a Major Barrier	58% of users who try new productivity tools abandon them	First-run experience must surface visible value within the first session. AI-guided

Finding	Data Point	Product Implication
	within 7 days. The primary reason cited: "couldn't see the value fast enough."	onboarding and quick-win templates are essential.

5.2 Unmet Needs by Persona

Persona	Top 3 Unmet Needs	JTBD Priority
P1 — Consultant	(1) Unified portfolio view (2) AI that knows my business (3) Easy invoicing from project context	High — full platform user; highest ARPU
P2 — Cooperative	(1) Governance tooling (2) Transparent distributions (3) Capital management	High — underserved market; strong B2B pricing signal
P3 — Gig Worker	(1) Transition planning support (2) Simple payment collection (3) Community/peer support	Medium — large volume; lower ARPU; freemium entry point
P4 — Investment Club	(1) Cap table management (2) Formal voting records (3) Automated distributions	High — strong willingness to pay for financial accuracy

6 · JTBD

Jobs to Be Done

The following Jobs to Be Done (JTBD) framework identifies the core functional, emotional, and social jobs that Kogi hires itself to do for each primary persona. Product requirements are derived from these jobs.

6.1 Core Functional Jobs

Job Statement	Persona	Priority	Current Hire
When I need to know the health of my overall professional life, help me see all projects, financials, and goals in one unified view.	All	Critical	Spreadsheet or "nothing — I just keep it in my head"
When I complete work for a client, help me collect payment quickly with zero friction and full professional presentation.	P1, P3	Critical	Stripe/PayPal + manual invoice creation
When I need to govern my cooperative's finances and decisions, help me run transparent proposals and fair distributions without disputes.	P2, P4	Critical	Email + Google Sheets + lawyer
When I have a new business idea, help me capture it instantly and develop it into a validated plan without losing momentum.	P1, P3	High	Notion + occasional ChatGPT
When my project is stuck or a resource is missing, help me find the right person or service immediately.	P1, P2	High	LinkedIn + Upwork + personal network
When I need to understand whether a goal is on track, help me see real-time progress tied to the work I'm actually doing.	P1, P2	High	Manual OKR spreadsheets or nothing
When I want to build a team or raise capital for a new venture, help me structure ownership and governance from the start.	P2, P4	High	Lawyer + Quickbooks + email
When I'm planning my week or quarter, help me allocate time and effort intelligently across all my competing commitments.	All	High	Paper calendar + mental juggling

6.2 Emotional & Social Jobs

Job Statement	Persona	Kogi Capability
When I feel isolated working alone, help me feel like I'm part of a professional community that understands my specific situation.	P1, P3	Community module — Spaces, rooms, peer connections
When I'm in a financial dispute with a client, help me feel protected and give me a clear process to resolve it without a lawyer.	P1, P3	Exchange module — escrow, dispute resolution
When I achieve a milestone, help me share it in a context where people understand what it means to run your own business.	All	Community module — portfolio highlights, achievement posts
When my cooperative members don't trust the financial records, help me make every number transparent and auditable.	P2, P4	Exchange + AO module — immutable ledger, governance log
When I'm considering quitting gig work, help me feel like I have a real plan and visible progress toward something I own.	P3	Portfolio + Studio + Work module — transition roadmap

7 · COMPETITION

Competitive Landscape

7.1 Competitive Matrix

No single competitor covers Kogi's full scope. The competitive threat is the combination of best-in-class point solutions, not a single platform.

Capability	Kogi	Notion	Upwork/Fiverr	Stripe	QuickBooks	Gnosis Safe	Monday/Asana
Unified Portfolio	✅ Full	⚠️ DIY only	❌	❌	❌	❌	⚠️ Projects only
Integrated Payments	✅ Full	❌	⚠️ Platform-only	✅ API only	⚠️ Bookkeeping	❌	❌
Cooperative Governance	✅ Native	❌	❌	❌	❌	⚠️ Web3 only	❌
AI — Portfolio-Aware	✅ Deep	⚠️ Generic	❌	❌	⚠️ Basic	❌	⚠️ Basic
Marketplace	✅ Integrated	❌	✅ Standalone	❌	❌	❌	❌
Community / Social	✅ Native	❌	⚠️ Basic	❌	❌	❌	⚠️ Team only
Idea Studio / Innovation	✅ Native	⚠️ DIY	❌	❌	❌	❌	❌
Worker-Owned Model	✅ Core value	❌	❌ Extractive	❌	❌	⚠️ Decentralized	❌

7.2 Competitive Moats

Moat Type	Description	Time to Build
Data Network Effects	The more portfolio, project, and financial data a user puts into Kogi, the better the AI recommendations, health scores, and market matches become. This data flywheel is impossible for a new entrant to replicate without years of user data.	18–36 months
Community Network Effects	The professional community in Kogi becomes more valuable as more independent workers join. Referrals, collaborations, and marketplace liquidity all improve with scale — and are deeply integrated with the work and financial system.	12–24 months
Cooperative Governance Infrastructure	Building AO governance, cap table management, and cooperative distributions is technically hard and legally complex. First mover in this space who gets it right builds a strong lock-in.	Now (differentiator in Year 1)
Integrated Financial Rail	A payment, escrow, and distribution system that is deeply integrated with project and portfolio management creates switching costs that a standalone invoicing tool cannot create.	6–12 months (launch to maturity)
AI Context Depth	An AI agent that has 12+ months of a user's full portfolio, project, financial, and community history is categorically more useful than a general-purpose LLM. This context depth takes time to accumulate and is non-transferable.	12–24 months per user

8 · VISION

Product Vision & North Star

8.1 Vision Statement

Kogi Platform Vision

Kogi is the operating system for independent work — a platform where every person, cooperative, and autonomous organization can manage their complete professional and economic life: their projects, their money, their community, and their future. We build for the worker, not the employer.

8.2 North Star Metric

North Star: Weekly Active Portfolio Value (WAPV) — the aggregate economic value actively managed on the Kogi platform by weekly active users, measured in USD equivalent across all asset types (project value, capital under management, marketplace GMV, cooperative treasury).

This metric captures whether users are bringing their real economic activity to Kogi, not just their task management. It grows when users add more of their financial and professional life to the platform, which is the behavior that creates retention and network effects.

Metric	Y1 Target	Y2 Target	Y3 Target
Weekly Active Portfolio Value (WAPV)	$500M	$2B	$8B
Monthly Active Users (MAU)	50,000	250,000	1,000,000
Monthly Recurring Revenue (MRR)	$750K	$4.5M	$18M
Gross Marketplace Volume (GMV)	$50M	$300M	$1.5B
Cooperatives & AOs Active	500	5,000	25,000
Net Revenue Retention (NRR)	≥100%	≥110%	≥120%
User-Reported Time Saved vs. Prev. Stack	4h/wk avg	6h/wk avg	8h/wk avg

8.3 Product Principles

- Worker-first: every product decision is evaluated from the worker's perspective, not the platform's extraction opportunity.
- Radical integration: modules must share data natively; an action in one module should update relevant state in all connected modules automatically.
- Progressive complexity: the simplest user flows must be extremely simple; advanced capabilities reveal themselves as users grow into them.
- Transparent AI: the AI agent shows its reasoning, cites sources, and asks permission before acting. Trust is earned through accuracy and transparency, not impressive presentations.
- Cooperative by default: collective ownership and democratic governance are not edge cases — they are first-class features with the same quality bar as individual user features.

9 · STRATEGY

Strategic Pillars

Kogi's product strategy is organized around five strategic pillars. Each pillar is supported by specific product capabilities and drives a distinct part of the growth and retention model.

Pillar	One-Line Definition	Core Modules	Growth Mechanism
1 — The Unified Portfolio	One place to see everything you are and everything you own	Portfolio, WBS, Studio, Work/OKR	Onboarding hook: "add your first project in 90 seconds." Breadth of portfolio creates retention through sunk cost and data value.
2 — The Integrated Economy	Every financial transaction from invoice to distribution in one system	Exchange, Market, Crowdfunding	Transaction revenue flywheel: more users → more marketplace liquidity → more GMV → more transaction revenue → better AI recommendations → more users.
3 — Democratic Capital	The only platform purpose-built for cooperative and collective ownership	AO Governance, Crowdfunding, Exchange (distributions)	Cooperative adoption creates organizational-level subscriptions (B2B pricing), higher NRR, and word-of-mouth within cooperative networks.
4 — Contextual AI	An AI agent that knows your entire professional life	AI Agent (all modules)	AI quality improves with data depth, creating compounding advantage for long-tenure users and making the platform genuinely hard to leave.
5 — The Worker Community	A professional network built for and governed by independent workers	Community, Market (discovery), Social Graph	Community creates organic acquisition (referrals), reduces churn (social ties), and drives marketplace liquidity (worker-to-worker commerce).

9.1 Pillar Sequencing

Not all pillars are equal in launch priority. The sequencing below is driven by which capabilities create the most immediate user value and which create the network effects that fuel later pillars.

Phase	Timeline	Pillars Active	Milestone
Phase 1 — Anchor	Launch to Month 6	1 (Unified Portfolio) + 4 (AI, basic)	1,000 paying users; avg. 3+ portfolio items per user; D30 retention ≥ 40%

Phase	Timeline	Pillars Active	Milestone
Phase 2 — Economy	Month 4–12	2 (Integrated Economy) full launch	$1M GMV in first 60 days of marketplace; 25% of users connect a payment method
Phase 3 — Community	Month 6–18	5 (Worker Community)	100 active Spaces; 10,000 community-sourced referrals in first 6 months
Phase 4 — Cooperative	Month 12–24	3 (Democratic Capital) full launch	200 cooperatives active; $10M cooperative capital under management
Phase 5 — Flywheel	Month 18+	All pillars integrated; AI quality compounds	NRR > 110%; WAPV growing 20% MoM; organic acquisition > paid acquisition

10 · METRICS

Product Goals & Success Metrics

10.1 Acquisition Metrics

Metric	Definition	Y1 Target	Measurement
Monthly New Signups	New accounts created per month	5,000 → 15,000 by M12	auth-svc event: user.registered
Paid Conversion Rate	% of free users who upgrade within 60 days	15%	Subscription events
CAC (Blended)	Total S&M spend / new paid users in period	< $80	Finance dashboard
Organic vs. Paid Ratio	% of signups from organic sources (community, referral, SEO)	40% organic by M12	UTM tracking + attribution model
Time to First Value	Time from signup to first meaningful action (1st portfolio item created)	< 5 minutes median	Product analytics funnel

10.2 Engagement Metrics

Metric	Definition	Target	Measurement
Daily Active Users / MAU (DAU/MAU)	Stickiness ratio — what fraction of monthly users are daily	> 35%	Session events
Weekly Active Portfolio Value (WAPV)	Aggregate economic value managed by WAUs	$500M Y1 → $8B Y3	Portfolio + Exchange combined metric
Modules per Active User	Average number of distinct modules used per WAU	> 3 by M6; > 4 by M12	Module engagement events
AI Agent Weekly Usage Rate	% of Pro+ users who use AI Agent at least once per week	> 60%	ai.session.created events
Marketplace Transaction Rate	% of Market-enabled users who complete at	> 20%	market.order.completed events

Metric	Definition	Target	Measurement
	least 1 transaction per month		
Community Participation Rate	% of users who post, reply, or react at least once per week	> 40%	Community engagement events

10.3 Retention Metrics

Metric	Definition	Target
D7 Retention	% of new users still active 7 days after signup	> 45%
D30 Retention	% of new users still active 30 days after signup	> 30%
M3 Retention (paying)	% of new paying users still paying at month 3	> 75%
M12 Retention (paying)	% of new paying users still paying at month 12	> 60%
Net Revenue Retention	Revenue retained + expanded / starting ARR	> 100% (Y1), > 110% (Y2+)
Churn Rate (monthly)	% of paying users who cancel per month	< 4% monthly
Resurrection Rate	% of churned users who return within 90 days	> 15%

11 · FEATURES

Feature Strategy & Prioritization

11.1 MoSCoW Framework — v1.0 Launch

Features are classified as Must Have (launch blocker), Should Have (strong v1.0 value), Could Have (v1.x if capacity allows), or Won't Have (explicitly deferred to v2+).

Feature	Category	Effort	Rationale
Workspace + Account provisioning	Must Have	M	Foundation for all other features; no platform without it
Portfolio hierarchy (Program/Project/Resource)	Must Have	L	Core value prop; onboarding anchor
WBS with Kanban and Agile board views	Must Have	L	Task execution; needed for consultant persona (P1)
Exchange — invoicing and payment collection	Must Have	L	Strongest near-term value prop; financial pain is universal
Exchange — Escrow for market transactions	Must Have	L	Required for safe marketplace operation
Market — Listings and gig/service orders	Must Have	L	Transaction revenue; marketplace network effect
AI Agent — basic chat with portfolio context	Must Have	M	Differentiator; required for Pro tier value
Community — Spaces and threaded rooms	Must Have	M	Retention driver; acquisition channel
Idea Studio — capture and concept stage	Should Have	M	Strong for P3 (gig → entrepreneur) persona
Work — OKRs with story linkage	Should Have	M	Valuable for P1; differentiates from basic PM tools
Work — Automation rules	Should Have	M	Pro tier value; reduces manual work
AI Agent — autonomous actions (create story, search market)	Should Have	L	Fulfills "AI that works with you" promise
Crowdfunding — reward + donation campaigns	Should Have	L	Enables capital pillar; cooperative use case entry point
AO Governance — basic proposal + voting	Should Have	L	Cooperative persona (P2, P4) retention; differentiated

Feature	Category	Effort	Rationale
Idea Studio — full 5-stage pipeline	Could Have	L	Complex; valuable but not launch-critical
Exchange — cooperative distributions	Could Have	M	High value for P2/P4 but niche at launch
AO Governance — full charter + cap table	Could Have	L	Important for cooperative launch; deferred if timeline slips
Native mobile app (iOS/Android)	Could Have	XL	PWA covers mobile for launch; native in Y2
Enterprise SSO + audit logs	Won't Have (v1)	M	Y2 enterprise motion
Third-party plugin marketplace	Won't Have (v1)	XL	Platform maturity required first
Blockchain/on-chain governance anchoring	Won't Have (v1)	L	Deferred; not core user need at launch

11.2 v1.0 Release Scope Summary

Module	v1.0 Status	Key Deferred Items
User & Workspace	Complete	Enterprise SSO
Portfolio	Complete	Portfolio sharing link (v1.x)
WBS & Stories	Complete	GitHub integration (v1.x)
Market	Complete	RFP listings (v1.x)
Exchange	Partial — fiat + escrow + credits	Equity, revenue-share, full distributions (v1.x)
Idea Studio	Partial — stages 1–3	Stages 4–5 (prototype + design) in v1.x
Community	Complete	Video rooms > 10 participants (v1.x)
Work / OKRs	Complete	Advanced capacity planning (v1.x)
Crowdfunding	Partial — reward + donation	Equity campaign (v1.x — requires legal clearance)
AO Governance	Partial — proposals + voting	Full charter builder, cap table (v1.x)
AI Agent	Partial — chat + basic actions	Full autonomous action suite (v1.x)

12 · MODULES

Module-by-Module Product Requirements

Each module below is specified at the product requirements level: user goals, key user flows, acceptance criteria, and success metrics. Technical implementation is covered in the Platform Requirements Specification (PRS) and LLSDS companion documents.

12.1 Portfolio System

User Goal	Key User Flow	Success Criterion
See everything I'm working on in one place	Sign in → Dashboard → View Portfolio summary with item count, health score, and recent activity	Portfolio dashboard loads in < 2 seconds with all items visible
Organize my work by domain (business, personal, investments)	Create Portfolio → Add item → Assign domain tag → Filter by domain	User can filter portfolio by domain and see only relevant items
Share a professional overview with a potential client	Portfolio item → Set visibility=Public → Copy shareable link → Share with client	Shared link opens read-only view without requiring recipient to create account
Know if my overall business is healthy	View health score → Drill into score breakdown → See which items are dragging score	Health score updates within 24h of significant status changes; drill-down explains each factor

12.2 Market System

User Goal	Key User Flow	Success Criterion
Find and hire a specialist when a project is stuck	Story marked BLOCKED → AI surfaces relevant Market listings → Review listings → Place order → Story automatically linked to order	Time from block to first relevant listing displayed < 10 seconds
List my services and get hired	Profile complete → Create Listing → Set pricing and availability → Listing goes live → Receive inquiry → Accept order	Time from profile complete to first active listing < 5 minutes
Get paid safely for completed work	Accept order → Complete work → Submit delivery → Buyer approves → Funds released to wallet	Escrow release occurs within 30 minutes of buyer approval; no manual intervention required

User Goal	Key User Flow	Success Criterion
Discover new client opportunities	Browse Market Home → View AI-recommended listings for my skill profile → See "Opportunities" for my expertise	Recommendation relevance rating > 4/5 in user feedback; CTR on recommendations > 15%

12.3 Exchange System

User Goal	Key User Flow	Success Criterion
Get paid by a client without a paper invoice	Complete project story → Generate invoice in 1 click → Send payment link → Client pays → Funds in wallet	Invoice generated and sent in < 60 seconds; payment link works without client signup
Distribute cooperative earnings to members fairly	AO Capital Pool balance → Create distribution → System calculates each member's share → Members approve (governance) → Funds distributed	Distribution calculation is auditable; every member can verify their own allocation
Manage a shared investment pool with full transparency	Create Capital Pool → Members contribute → View immutable transaction log → Propose withdrawal → Vote → Execute	Every member sees same balance at all times; no discrepancies possible from UI

12.4 Idea Studio

User Goal	Key User Flow	Success Criterion
Capture a business idea in under 10 seconds without losing momentum	Tap "Capture" anywhere in app → Type/speak idea → Auto-saved → Return to work	Capture flow has max 2 taps from anywhere in the app; no required fields
Develop an idea into a validated plan with AI help	Open captured idea → AI generates synthesis (problem, market, viability) → User reviews → Fills in Business Model Canvas template	AI synthesis complete within 60 seconds of advancing to Concept stage; user rates synthesis quality ≥ 4/5
Protect my invention before disclosing to others	Complete idea description → Request IP timestamp → System creates signed, timestamped record → Download certificate	IP timestamp generated and available for download within 30 seconds

12.5 AI Agent

User Goal	Key User Flow	Success Criterion
Get help with my specific business without re-explaining everything each time	Open AI chat → Ask "which of my projects is most at risk?" → Agent reads portfolio and responds with specific project names and risk factors	Agent correctly identifies at-risk projects using actual portfolio data in > 85% of test cases
Automate repetitive work tasks without programming	Open Automation settings → "When a story is blocked for 24h, search market for relevant providers" → Enable → Test	Automation triggers correctly in > 95% of valid trigger conditions
Get a heads-up before problems become crises	Receive alert: "Milestone X is 3 days from deadline with 40% of stories not done" → Click → See milestone status → Take action	Alert fired before deadline in > 99% of cases; false positive rate < 10%

12.6 Community & Social

User Goal	Key User Flow	Success Criterion
Find and connect with other independent workers in my industry	Browse Spaces → Discover relevant spaces by tag/industry → Join → Introduce self → Get replies within 24h	Discovery returns relevant Spaces in < 2 seconds; new member posts receive ≥ 1 reply within 24h (community health metric)
Refer work to trusted colleagues and get referrals back	Connect with colleague → Their market listings visible to me → Refer a client → Track referral outcome	Referral tracking shows conversion from referral to paid order; referrer notified on completion
Collaborate on a project with a distributed team	Create Project Space → Invite team → Assign stories in WBS → Discuss in linked Room → Real-time updates	Story status updates appear in linked Room within 30 seconds; no page refresh required

12.7 AO Governance

User Goal	Key User Flow	Success Criterion
Form a cooperative without a lawyer	Create AO → Select charter template (e.g. worker cooperative) → Configure governance params → Invite founding members → Ratify charter by vote	Time from "Create AO" to first governance vote < 30 minutes with template
Run a transparent member vote on a major decision	Draft proposal → Submit → Members notified → Voting	Outcome recorded within 5 minutes of voting close;

User Goal	Key User Flow	Success Criterion
	window opens → Members vote → Outcome recorded → Downstream action executed	downstream actions (e.g. capital transfer) execute within 1 hour of passed vote
Know that our governance records are permanent and auditable	View Governance Log → See every proposal, every vote, every outcome since founding → Export full history	Governance log is append-only; no admin can delete or modify records; full export available in CSV and JSON

13 · DESIGN

User Experience Principles

Principle	Description	Product Implication
Progressive Disclosure	Surface only what the user needs for their current task. Reveal advanced capabilities as the user grows.	Onboarding shows 3 features. Dashboard defaults to simple view. Advanced settings behind an "Advanced" toggle.
Zero-Friction Capture	Any idea, task, or data point must be capturable in < 3 taps/clicks. No required fields for capture.	Global "+" button accessible from every screen. Idea capture has 0 required fields. Voice capture first-class.
Radical Transparency	Users must always be able to see the data behind any number, score, or AI-generated recommendation.	Health score → drill-down to factors. AI recommendation → "Why was this recommended?" link. Ledger entries → always viewable.
Cooperative-First Design	Governance, shared ownership, and collective decision-making must be as polished as individual features. Co-op users are not second-class users.	Every financial feature has a "shared/cooperative" mode. Governance features in main navigation, not buried in settings.
Calm Technology	The platform should reduce cognitive load, not add to it. Notifications must be actionable and minimal.	Default notification settings are conservative. AI alerts are batched into a daily digest by default. No empty states with "add more content!" nudges.
Mobile-Responsive First	The web application must be fully functional on mobile viewport from day one.	All flows designed mobile-first. No feature can be "desktop only" at launch.
Dark Mode First	Kogi's default visual theme is dark mode, reflecting the "operator/professional" tone of the platform.	Dark theme is the default. Light mode available as an accessibility and preference option.

13.1 Onboarding Critical Path

The first session is make-or-break for a productivity platform. The critical path below must be achievable in under 5 minutes for a new user.

1. Create account (OAuth or email). Provisioning of workspace + portfolio is automatic — user never sees a loading spinner.

2. Persona selection (30 seconds): "What best describes you?" (Freelancer / Cooperative member / Side project builder / Investment club). Selection pre-configures the workspace template and surfaces relevant module onboarding.
3. First portfolio item (90 seconds): "What are you working on right now?" — one text field, one tag, done. Item appears immediately in portfolio.
4. First AI interaction (60 seconds): AI Agent says "I've set up your workspace. Here's what I see..." — contextual summary based on the item they just added. One follow-up question from AI that demonstrates contextual awareness.
5. One optional step: "Add a payment method to send your first invoice" — for users who select Freelancer persona.

14 · GO-TO-MARKET

Go-to-Market Strategy

14.1 Launch Segments (Prioritized)

Segment	Why First	Acquisition Channel	Conversion Hook
Tech Freelancers (P1 persona)	Tech-savvy, high ARPU ($35+/mo), vocal online community, already paying for multiple tools Kogi replaces	Developer community (HackerNews, DevTo, GitHub), LinkedIn, SEO for "freelance developer tools"	Free tier with immediately useful portfolio + WBS; upgrade path to Pro is natural when adding Market or Exchange
Worker Cooperative Networks	Unaddressed market; strong word-of-mouth within coop networks; high org-level ARPU; mission alignment	National Center for Employee Ownership (NCEO), US Federation of Worker Cooperatives (USFWC), direct partnerships	Free org trial; governance demo targeting cooperative pain point (#1: transparent distributions)
Side Project Community	Large volume; enthusiastic sharers; strong organic acquisition potential via "built with Kogi" badge and portfolio sharing	Product Hunt, Indie Hackers, Twitter/X, Reddit (r/entrepreneur, r/SideProject)	Free tier forever for hobbyists; upgrade trigger: "Want AI to help develop your idea?"
Investment / Real Estate Clubs	High willingness to pay for financial accuracy; strong word-of-mouth in investor networks; P4 persona	Real estate investor communities (BiggerPockets), angel investor groups, direct outreach	Free org trial; capital pool demo targeting pain point (#1: transparent records)

14.2 Pricing Strategy

Tier	Price	Target Persona	Key Value
Free	$0/mo	P3 (Gig worker), hobbyist, side project builder	Portfolio + basic WBS + Idea Studio stages 1–2 + Community + limited AI credits (20/mo). Permanent free tier to maximize top of funnel.
Starter	$15/mo	P3 growing, early P1	Full Portfolio + WBS + Studio all stages + Market (buyer) + basic

Tier	Price	Target Persona	Key Value
			Exchange + 200 AI credits/mo. First paid tier.
Pro	$35/mo	P1 (Consultant), serious independent worker	Everything + Market (seller) + full Exchange + Automation + 2000 AI credits/mo + priority support.
Team	$80/mo (up to 10 seats)	Small team, early cooperative	Pro for up to 10 members + shared workspace + basic governance + team Analytics.
Cooperative / AO	$200/mo (up to 50 members; +$3/member above 50)	P2 (Cooperative), P4 (Investment club)	Full AO governance + Capital Pool + distributions + unlimited members + dedicated onboarding.
Enterprise	Custom	Large org, enterprise freelancer network	SSO + data residency + SLA + dedicated success manager + custom integrations.

15 · RISKS

Risks & Mitigations

Risk	Likelihood	Impact	Mitigation
Financial regulatory complexity causes Exchange launch delay or scope reduction	High	Critical	Engage fintech legal counsel early; launch with Stripe-only fiat path (no equity, no complex instruments) in v1.0; add complex value types post-legal clearance
AI Agent quality is perceived as "generic" and fails to differentiate	Medium	High	Invest heavily in portfolio context injection for all AI prompts; instrument and track AI quality scores; create dedicated AI quality team; ship AI features only when context quality is demonstrably better than GPT-4 with no context
Cooperative/AO module adoption is slower than projected	Medium	Medium	Separate GTM motion for cooperative segment; partnerships with cooperative federations; free org tier for qualified cooperatives; don't block overall growth on cooperative adoption
Marketplace liquidity problem (chicken-and-egg: need buyers and sellers simultaneously)	High	High	Seed with invited supply (50–100 vetted providers pre-launch); launch with geographic and category focus; buyer-first acquisition to create demand before broad seller onboarding
Data privacy incidents erode user trust	Low	Critical	Privacy-by-design architecture; annual third-party security audit; breach response plan; data residency options for EU users; transparent privacy policy and security page
Incumbent responds with integrated offering (e.g. Notion adds payments, Stripe adds project management)	Medium	Medium	Kogi's moat is data integration depth, not feature breadth. An incumbent adding a feature doesn't replicate Kogi's cross-module data model. Focus on compounding data network effects.
Platform complexity overwhelms new users; onboarding funnel abandonment is high	High	High	Radical progressive disclosure; persona-based onboarding templates; user testing for onboarding flow before launch; D7 retention as primary engineering KPI for first 6 months

16 · ASSUMPTIONS

Assumptions & Open Questions

16.1 Key Assumptions

Assumption	Confidence	Validation Method	If Wrong
Independent workers will pay $35/mo for a unified platform if it demonstrably saves 4+ hours/week	High	Pricing survey + beta user interviews + paid beta conversion rate	Drop to $25/mo Pro; strengthen free → paid conversion flow
A marketplace seeded with 50 high-quality providers will achieve sufficient liquidity at launch	Medium	Measure D30 buyer-to-order conversion rate; track time-to-first-match	Expand provider onboarding; introduce "request for proposal" as a demand signal before supply is ready
AI agents with deep portfolio context will be meaningfully better than general-purpose AI tools	High	A/B test: same queries with/without portfolio context; measure user satisfaction rating	Invest in more sophisticated context injection; consider fine-tuned model layer on top of base LLM
Cooperative organizations will adopt a new software platform despite inertia toward established tools	Medium	Pilot with 10 cooperatives; measure 30-day retention and "would recommend" score	Create a 1-click import from existing cooperative tools; invest in migration tooling
Workers will use Kogi as their primary community platform, not just as a work tool	Medium	Track community DAU/MAU ratio; survey community quality perception at M3	Accelerate community flywheel: invest in community editorial, curated Spaces, and featured member programs

16.2 Open Questions

Question	Owner	Decision Deadline	Options Under Consideration
Should equity-based crowdfunding be in v1.0 or deferred?	Legal + Product	Pre-launch	(A) Launch with Reg CF compliance in v1.0 — high regulatory risk. (B) Defer equity campaigns to v1.x with dedicated legal clearance — recommended.

Question	Owner	Decision Deadline	Options Under Consideration
Should the AI Agent have a persistent memory across sessions by default, or opt-in?	Product + Privacy	3 months pre-launch	(A) Persistent by default — better AI quality, privacy concern. (B) Opt-in — lower quality by default, stronger trust signal.
What is the right balance between community moderation (platform) vs. community governance (members)?	Product + Legal	3 months pre-launch	(A) Platform-moderated: faster, lower quality risk. (B) Member-governed: consistent with cooperative values, higher operational risk.
Should Kogi own the payment rail or white-label Stripe Connect?	Engineering + Legal	Now	(A) Own rail — higher margin, massive regulatory burden. (B) Stripe Connect — lower margin, immediate compliance, faster launch. Recommend (B) for v1.0.

17 · GLOSSARY

Appendix — Glossary

Term	Definition
AO (Autonomous Organization)	A Kogi entity with its own charter, capital pool, governance system, and member network.
ARPU	Average Revenue Per User — annual subscription + transaction revenue divided by active user count.
CAC	Customer Acquisition Cost — total sales and marketing spend divided by new paying customers in a period.
Cooperative	A member-owned organization with democratic governance; a specific type of AO.
DAU/MAU	Daily Active Users divided by Monthly Active Users — a "stickiness" ratio.
Escrow	Funds held by the Exchange System on behalf of two parties pending delivery confirmation.
GMV	Gross Marketplace Volume — total transaction value flowing through the Kogi marketplace.
JTBD	Jobs to Be Done — a framework for understanding customer motivation by the "job" they hire a product to accomplish.
MoSCoW	Must Have / Should Have / Could Have / Won't Have — a feature prioritization framework.
NRR	Net Revenue Retention — revenue retained and expanded from existing customers over a period (>100% = growth within existing base).
North Star Metric	The single most important metric that best captures whether the product is creating value for users.
OKR	Objectives and Key Results — a goal-setting framework.
PRD	Product Requirements Document — this document.
Pillar	One of Kogi's five strategic product areas: Unified Portfolio, Integrated Economy, Democratic Capital, Contextual AI, Worker Community.
Portfolio	The root organizational unit in Kogi — a container for all of a user's or organization's work, assets, and goals.
TAM / SAM / SOM	Total Addressable Market / Serviceable Addressable Market / Serviceable Obtainable Market — market sizing framework.
WBS	Work Breakdown Structure — a hierarchical decomposition of work into executable stories and tasks.

Term	Definition
WAPV	Weekly Active Portfolio Value — Kogi's North Star Metric; total economic value managed by weekly active users.

Kogi Platform — Product Requirements Document
