KOGI

Independent Worker Operating System

Example Workflows & Use Cases

Real-world scenarios demonstrating end-to-end platform capabilities

Document Type	Workflows & Use Cases Reference
Platform	Kogi Independent Worker OS
Audience	Product, Engineering, Business Development
Scenarios Covered	8 major use cases across 5 domains

Overview

This document presents eight detailed, end-to-end workflows and use cases for the Kogi platform. Each scenario demonstrates how Kogi's modular components — portfolio management, work execution, agile planning, group economics, autonomous organizations, and the event bus — work together to serve real users and teams.

Each use case follows a consistent format: context, actors, step-by-step workflow, Kogi modules used, and outcomes.

#	Use Case	Domain	Primary Actors
1	Freelancer Onboarding & First Project	Independent Work	Freelancer, AI Agent
2	Software Product Launch	Product Development	Product Manager, Engineers, AI Agents
3	Community Solar Farm Campaign	Group Economics	Community Organizer, Contributors, AO
4	Open Source Library Release	Autonomous Organization	Contributors, AO, AI Reviewer
5	Startup Founding & Operations	Venture Management	Founders, Investors, AI Agent
6	Enterprise Portfolio Review	Portfolio Management	Executive, Project Managers
7	Freelance Marketplace Gig	Marketplace & Gigs	Client, Freelancer, AI Matcher
8	Research & Prototype Sprint	Discovery & Innovation	Researcher, Designer, AI Agent

👤 Use Case 1: Freelancer Onboarding & First Project

An independent worker joins Kogi, sets up their workspace, and lands their first client project

Context

Maria is a freelance UX designer who has just joined Kogi. She needs to set up her professional profile, organize her portfolio, find a client project, deliver it, and get paid — all within the Kogi ecosystem.

Actors

- Maria — freelance UX designer
- Client — a startup needing a mobile app redesign
- Kogi AI Agent — assists with matching, scheduling, and delivery tracking

Workflow

1	**Account & Workspace Provisioning** Maria registers on Kogi. The Kernel automatically provisions her Account (profile, keys, tokens), Workspace (hub, tools, comms), and root Portfolio.
2	**Profile & Portfolio Setup** Maria populates her Solutions Portfolio with portfolio items: past projects as Resources (artifacts), a service catalogue, and her skills as capabilities.
3	**Marketplace Listing** Maria creates a Gig listing in her portfolio's Marketplace domain — service type, rate, availability, and deliverables. The AI Agent indexes her profile for discovery.
4	**Client Match & Contract** A client searches the Kogi marketplace for UX designers. The AI Matcher surfaces Maria's profile. They connect, negotiate scope, and a Contract Story is created in Maria's portfolio.
5	**Project Kickoff** A Project is created under a Program ('Client Work Q2'). A WBS is generated: Work Package → Themes (Discovery, Design, Delivery) → Epics → Stories → Tasks.
6	**Execution via Agile Board** Maria tracks work on her Agile Board. Stories move from Backlog → In Progress → Review → Done. The AI Agent sends deadline reminders and flags blockers.
7	**Deliverable & Review** Completed design files are attached to the project as Artifacts in a Briefcase container. The client reviews via a shared workspace view and approves.

8	**Payment & Outcome Recording** Payment is processed. The project outcome (Deliverable) is recorded and the Contract Story is closed. Maria's portfolio updates with a new completed project.
✓	**Complete** Maria's portfolio now shows a completed client project, earned capital, and a new professional artifact — all tracked and searchable on Kogi.

🔧 Kogi Modules Used

Portfolio • Workspace • Marketplace • Agile Boards • WBS • Story System • Communications • Project Tracking

✅ Outcomes

- Freelancer is fully onboarded with a structured portfolio in under an hour
- Client project delivered on time with full audit trail of work
- Deliverables stored as artifacts in portfolio for future reference
- Payment and contract history tracked in account
- AI Agent reduces admin overhead by ~60% through automation

🚀 Use Case 2: Software Product Launch

A product team uses Kogi to plan, build, and ship a new SaaS application

Context

A team of 8 (2 product managers, 4 engineers, 1 designer, 1 QA) is building a new SaaS analytics tool. They use Kogi as their operating system for the entire product lifecycle — from idea to launch.

Actors

- Product Manager — owns roadmap and story prioritization
- Engineers — execute development tasks
- Designer — executes design stories
- QA Engineer — owns test stories and audit stories
- AI Agent — assists with planning, risk detection, and release automation

Workflow

1	**Product Portfolio Setup** A Solutions Portfolio is created for the product. Sub-portfolios are created for: Product Roadmap, Engineering, Design, and QA.
2	**WBS Construction** A WBS is built top-down: Work Package (v1.0 Launch) → Themes (Core Platform, Auth, Analytics, UI) → Initiatives → Epics → Stories → Tasks.
3	**Story Backlog Population** Product Manager creates Feature, Capability, Enabler, and Requirement stories. AI Agent suggests missing edge cases and flags dependencies.
4	**Sprint Planning** Team runs 2-week sprints using the Agile Board. Stories are assigned to executors (human engineers + AI agent for boilerplate code generation).
5	**Design & Development Execution** Designer works on Design stories. Engineers execute Feature and Enabler stories. AI Agent generates test scaffolding for each feature.
6	**QA & Audit** QA creates Test and Defect stories. Each defect links back to the originating Feature story. AI Agent runs regression checks automatically on completion.
7	**Release Milestone**

	A Milestone story ('v1.0 GA') is created with all dependency stories required to close. Roadmap view shows launch readiness in real time.
8	**Launch & Outcome Capture** Launch is executed. Outcome stories (Performance, Business Case results) are created post-launch to track KPIs. Event Bus broadcasts release_published.
✓	**Complete** v1.0 shipped with full traceability from idea → story → task → outcome, all within a single Kogi portfolio.

🔧 Kogi Modules Used

WBS • Story System • Agile Boards • Sprint Planning • Project Tracking • Roadmaps • Event Bus • AI Executor

✅ Outcomes

- Full product lifecycle managed in one platform with no context switching
- Every feature traceable from story to outcome
- AI Executor handles ~30% of routine code generation and test scaffolding
- Real-time launch readiness visible to all stakeholders
- Post-launch KPIs captured as Outcome stories for retrospective analysis

☀️ Use Case 3: Community Solar Farm Campaign

800 community members collectively fund and own a solar energy farm using Kogi's Group Economics module

Context

A neighborhood energy cooperative wants to build a $500,000 community solar farm. Members will crowdfund the project, receive equity stakes proportional to their contributions, and share revenue from electricity sales.

Actors

- Cooperative Organizer — creates and manages the campaign and AO
- 800 Community Contributors — fund the campaign and receive equity
- AI Agent — manages stake distribution, revenue allocation, and governance
- Autonomous Organization (AO) — governs the cooperative autonomously

Workflow

1	**AO Formation** The cooperative organizer creates an Autonomous Organization on Kogi. Charter, governance rules (one-person-one-vote + stake-weighted), and a Portfolio are initialized.
2	**Campaign Creation** An equity crowdfunding Campaign is created: Goal $500,000 | Deadline 90 days | Type: Equity | Beneficiary: Solar Farm Venture.
3	**Portfolio Listing** The Campaign and the Solar Farm Venture appear as portfolio items in the AO's Portfolio, visible to all members and potential contributors.
4	**Contribution Collection** 800 community members contribute between $100 and $5,000 each. Funds are held in escrow. The AI Agent issues contribution receipts and tracks the funding goal in real time.
5	**Goal Reached — Funds Released** Campaign hits $500,000. Event Bus fires campaign.funded. Escrow releases to the Capital Pool. AI Agent calculates equity stakes proportional to each contribution.
6	**Ownership Stakes Issued** Each contributor receives an Ownership Stake in the Solar Farm Venture stored in their personal Kogi portfolio.
7	**Project Execution**

	A Project is created in the AO portfolio for construction. A WBS (Site Prep, Installation, Grid Connection, Commissioning) is built. Processes are assigned to contractor executors.
8	**Revenue Distribution** Solar farm goes live. Monthly electricity revenue flows into the Capital Pool. The AI Agent runs the revenue_distribution process, allocating returns to stakeholders proportionally.
✓	**Complete** Community solar farm operational. Each of the 800 members receives monthly returns tracked transparently in their Kogi portfolio.

🔧 **Kogi Modules Used**

Crowdfunding • Capital Pools • AO Governance • Ownership Stakes • Portfolio • Project Tracking • Event Bus • AI Executor

✅ **Outcomes**

- $500,000 raised from 800 contributors in under 60 days
- Equity stakes automatically issued and stored in personal portfolios
- Solar farm constructed and operational via AO-managed project execution
- Monthly revenue distributions automated by AI Agent with full audit trail
- Governance votes conducted transparently via AO governance engine

🐙 Use Case 4: Open Source Library Release

An open-source community uses a Kogi AO to coordinate contributors, review code, and ship a public release

Context

The 'Zephyr' open-source data processing library has 120 contributors across 18 countries. The community uses a Kogi AO to manage feature requests, coordinate development, run automated reviews, and publish versioned releases.

Actors

- Core Maintainers (5) — govern the AO and approve merges
- Contributors (120) — execute feature and bug stories
- AI Agent — reviews code quality, runs tests, suggests optimizations
- AO — manages governance, resource allocation, and release process autonomously

Workflow

1	**Idea Capture** A contributor submits a new feature idea ('Parallel Stream Processing') as an Idea story in the AO portfolio. Community members upvote and comment via the workspace comms.
2	**AI Review & Prioritization** The AI Agent evaluates the idea: feasibility, impact, complexity, and dependencies. It auto-generates an Epic with child Stories and a draft WBS.
3	**Governance Vote** Core maintainers vote in the AO governance engine. Simple majority passes. The Epic is added to the v2.4 Work Package in the WBS.
4	**Contributor Assignment** The AO resource allocator assigns stories to available contributors based on skill tags. The AI Agent assigns test scaffolding tasks to itself.
5	**Execution & AI-Assisted Development** Contributors implement stories. The AI Agent reviews pull requests, flags code smells, and suggests optimizations. Defect stories are automatically created for failed tests.
6	**QA & Audit** A QA milestone story requires all Test stories to close. The AI Agent runs the full regression suite. Audit stories are logged for security-sensitive changes.
7	**Release Preparation**

	A Milestone story ('v2.4.0 Release') is created. Release notes are auto-drafted by the AI Agent from closed story titles and descriptions.
8	**Publish & Announce** Maintainer approves the release. Event Bus fires community.release_published. Documentation is updated. Contributors receive credit notifications via workspace comms.
✓	**Complete** v2.4.0 shipped. The AO roadmap automatically populates with ideas for v2.5 based on community feedback. Iteration cycle begins.

🔧 **Kogi Modules Used**

AO Governance • Story System • WBS • AI Executor • Event Bus • Agile Boards • Communications • Portfolio

✅ **Outcomes**

- 120 globally distributed contributors coordinated without manual overhead
- AI Agent handles code review, test generation, and release notes automatically
- Governance votes completed transparently with immutable audit trail
- Release shipped on schedule with full traceability from idea to deployed code
- Community engagement increases — contributors receive recognition in portfolio

🏢 Use Case 5: Startup Founding & Operations

A founding team uses Kogi as their complete operating system from ideation through seed funding and early operations

Context

Three co-founders are launching a B2B SaaS startup. They use Kogi to structure their equity, manage their company portfolio, run operations, raise a seed round, and track growth KPIs — all in one platform.

Actors

- 3 Co-Founders — own the company AO and portfolios
- Seed Investors (12) — contribute to the equity campaign
- AI Agent — handles financial modeling, resource allocation, and reporting
- Company AO — governs operations autonomously post-setup

Workflow

1	**Company AO Formation** Founders create a Company AO. Equity governance rules are set (stake-weighted voting, 2-of-3 co-founder quorum). Each founder's equity stake is recorded in the AO portfolio.
2	**Company Portfolio Structuring** A Solutions Portfolio is built: sub-portfolios for Product, Sales, Marketing, Engineering, and Finance. Resources (capital, IP assets, labor) are attached.
3	**Seed Round Campaign** An equity crowdfunding Campaign is created for the seed round: Goal $750,000 | Type: Equity | Valuation Cap: $5M. Shared with accredited investors via a private directory.
4	**Investor Contributions & Stakes** 12 investors contribute. Upon goal completion, the AI Agent calculates and issues ownership stakes to each investor, stored in their Kogi portfolios.
5	**Operational WBS** Company roadmap is decomposed into a WBS: Work Packages for Q1–Q4 → Themes (Product, GTM, Hiring) → Initiatives → Epics → Stories → Tasks. Assigned to executors (humans + AI).
6	**Hiring & Onboarding** Labor resources are added to the portfolio. New hires receive Kogi sub-accounts provisioned with their own workspace, team portfolio access, and tool permissions.

7	**KPI & Performance Tracking** Performance and Business Case stories track KPIs (MRR, churn, CAC). AI Agent generates weekly reports as Report stories and flags deviations from targets.
8	**Board & Investor Reporting** A Directory view (Investor Update Schedule) contains Report stories shared quarterly. AI Agent auto-drafts investor updates from portfolio outcome data.
✓	**Complete** The startup operates fully on Kogi: cap table, product roadmap, team execution, and investor relations all in a single, unified platform.

🔧 **Kogi Modules Used**

AO • Crowdfunding • Ownership Stakes • Portfolio • WBS • Story System • User Provisioning • AI Executor • Event Bus

✅ **Outcomes**

- Cap table and equity stakes managed automatically with full audit trail
- Seed round of $750,000 closed with 12 investors via the Kogi campaign system
- Full company operating plan structured in a single WBS
- New hires onboarded with auto-provisioned workspaces and portfolio access
- Investor reports auto-generated from live portfolio data — zero manual prep

📊 Use Case 6: Enterprise Portfolio Review

An executive team uses Kogi to conduct a quarterly portfolio review across 24 active projects

Context

A 200-person professional services firm runs 24 simultaneous client projects across 6 programs. Leadership uses Kogi's portfolio and project tracking tools for their quarterly business review (QBR) cycle.

Actors

- Chief Portfolio Officer — owns the enterprise portfolio
- Program Managers (6) — manage individual programs
- Project Managers (12) — track active projects
- AI Agent — aggregates data, identifies risks, and generates reports

Workflow

1	**Enterprise Portfolio Structure** A root Portfolio contains 6 Programs (by service line). Each Program contains 4 Projects. Projects contain Processes tracked against OKRs.
2	**QBR Initiation** The Chief Portfolio Officer creates a QBR Directory — an ordered schedule of Review stories (one per Program). AI Agent pre-populates each review with current status data.
3	**Program Health Pulls** AI Agent scans all 24 projects, aggregates story completion rates, budget burn, risks, and milestone status. A Performance story is created per program with a RAG status.
4	**Risk Identification** AI Agent flags Risk stories across all projects: timeline slippage, resource shortfalls, and scope creep. Risk stories are surfaced in a Risk Collection on the executive dashboard.
5	**Program Manager Briefs** Each of 6 Program Managers updates their Review story with commentary, blockers, and updated Gantt/roadmap views. Communications are threaded directly on stories.
6	**Executive Dashboard View** The CPO reviews a portfolio-level Roadmap view showing all 24 projects, RAG statuses, key milestones, and flagged risks in a single view — no spreadsheets needed.
7	**Decision Capture** Decisions made during the QBR are captured as Strategy and Tactic stories, assigned to executors, and added to the relevant program WBS.

8	**Report Generation** AI Agent generates the QBR Report story as a formatted Binder container with all program statuses, decisions, and action items — ready to share with the board.
✓	**Complete** QBR complete in half the usual time. All decisions tracked, risks documented, and action items already assigned in the platform.

🔧 Kogi Modules Used

Portfolio • Project Tracking • Roadmaps • Gantt Charts • Story System • AI Executor • Communications • Collections & Directories

✅ Outcomes

- QBR preparation time reduced by ~65% through AI-generated status aggregation
- 24 projects reviewed in a single unified view — no manual report compilation
- All risks surface automatically and tracked as live stories in the portfolio
- Board-ready report auto-generated from live portfolio data
- QBR decisions immediately in the system as assigned stories — zero delay to execution

🛒 Use Case 7: Freelance Marketplace Gig

A client posts a gig, the AI matches a freelancer, work is executed, and payment is settled — end to end on Kogi

Context

A small e-commerce company needs a 3-day data analysis gig: sales trend analysis, visualization, and a report. They post the gig on Kogi's marketplace, the AI matches a freelancer, and the work is delivered within the week.

Actors

- Client — e-commerce company needing data analysis
- Freelancer (Alex) — data analyst with a Kogi portfolio
- AI Matcher — surfaces the best-fit freelancer based on skills and availability

Workflow

1	**Gig Posting** Client creates a Gig portfolio item: 'Sales Trend Analysis — 3 days, $600'. Scope, deliverables, and deadline are added as story metadata. Posted to the Marketplace domain.
2	**AI Matching** AI Agent scans freelancer portfolios for data analysis capabilities, availability, and review history. Top 3 candidates are surfaced to the client with match scores.
3	**Selection & Contract** Client selects Alex. A Contract story is created, linked to both portfolios. Terms, deliverables, and payment milestones are embedded in the story.
4	**Shared Workspace Spin-Up** A shared Project workspace is created. Alex receives a provisioned view with the brief, timeline, and a Briefcase container for deliverable uploads.
5	**Work Execution** Alex creates Tasks in the project for each analysis workstream. As tasks complete, artifacts (charts, datasets, draft report) are uploaded to the shared Briefcase.
6	**Client Review** Client accesses the shared workspace, reviews deliverables, and leaves comments threaded on the Report story. Alex addresses revisions tracked as sub-tasks.
7	**Approval & Delivery** Client approves the final report. The Deliverable story is closed. Event Bus fires process.completed. The final Briefcase is locked and archived in both portfolios.

8	**Payment** Payment of $600 is processed and recorded as a Capital resource in Alex's portfolio. The Contract story closes. Both parties can leave reviews.
✓	**Complete** Entire gig lifecycle — post, match, execute, deliver, pay — completed on Kogi in under 5 days.

🔧 Kogi Modules Used

Marketplace • Portfolio • AI Matcher • Workspace • Project Tracking • Story System • Communications • Containers

✅ Outcomes

- Gig matched, contracted, and delivered in under 5 days
- AI matching reduces client sourcing time from hours to minutes
- Full deliverable audit trail stored in both portfolios
- Payment and contract history automatically recorded as financial resources
- Zero admin overhead — contract, delivery, and payment all automated on platform

🔬 Use Case 8: Research & Prototype Sprint

A product team runs a 1-week discovery sprint to validate a new product concept using Kogi's Idea Studio

Context

A product team at a healthtech company needs to rapidly explore and validate a new patient engagement concept. They run a structured research and prototyping sprint using Kogi's Idea + Prototype Studio and story system.

Actors

- Product Lead — owns the sprint and prioritizes findings
- UX Researcher — runs user interviews and synthesizes insights
- Designer — creates prototypes
- AI Agent — accelerates synthesis, pattern detection, and prototype generation

Workflow

1	**Sprint Portfolio Setup** A Research Sprint portfolio is created. Sub-items: Idea stories, Research stories, Prototype stories, and a Spike story for technical feasibility.
2	**Idea Capture** The team generates 14 concept ideas in the Idea Studio. Each is created as an Idea story with title, hypothesis, and success criteria. AI Agent clusters them by theme.
3	**Prioritization** AI Agent scores ideas on impact, feasibility, and alignment with strategy. Top 3 ideas are promoted to Concept stories and added to the sprint WBS.
4	**Research Execution** Research stories are created for: user interviews (5), competitive analysis, and literature review. Executors (researcher + AI Agent) are assigned. AI Agent synthesizes interview transcripts.
5	**Insight Synthesis** AI Agent generates an Insight Report story from all research outputs. Key themes, user pain points, and opportunity areas are surfaced automatically.
6	**Prototype Creation** Designer creates Prototype stories for the top 2 concepts. Wireframes and interactive mockups are built in the Idea Studio and attached as Artifact containers.

7	**Usability Testing** Test stories are created for 3 usability test sessions per prototype. Findings are captured as Defect and Requirement stories for the next iteration.
8	**Sprint Readout** Product Lead compiles the sprint outcomes into a Business Case story: recommended concept, evidence, risks, and next steps. Shared as a Binder container with stakeholders.
✓	**Complete** Sprint complete. One concept validated, documented, and ready for full development planning. All research artifacts stored in the portfolio for future reference.

🔧 **Kogi Modules Used**

Idea Studio • Story System • Portfolio • WBS • AI Executor • Containers • Communications • Project Tracking

✅ **Outcomes**

- 14 ideas generated, prioritized, and narrowed to 1 validated concept in 5 days
- AI Agent reduced synthesis time from ~8 hours to ~45 minutes
- All research artifacts permanently stored and searchable in portfolio
- Business case auto-assembled from sprint story data
- Validated concept immediately ready for handoff into product WBS

Summary: Kogi Platform Capabilities

Across these eight use cases, the Kogi platform demonstrates end-to-end coverage of how independent workers, teams, communities, and organizations operate. The table below maps each use case to the platform capabilities it exercises.

Use Case	Portfolio	WBS / Agile	AI Executor	Group Econ	AO / Governance	Event Bus
1. Freelancer Onboarding	✓	✓	✓	—	—	✓
2. Software Product Launch	✓	✓	✓	—	—	✓
3. Community Solar Farm	✓	✓	✓	✓	✓	✓
4. Open Source Release	✓	✓	✓	—	✓	✓
5. Startup Operations	✓	✓	✓	✓	✓	✓
6. Enterprise QBR	✓	✓	✓	—	—	✓
7. Freelance Marketplace Gig	✓	✓	✓	—	—	✓
8. Research Sprint	✓	✓	✓	—	—	—

Key Platform Patterns

Everything is a Portfolio Item: Every object — campaigns, projects, gigs, ideas, research artifacts — lives in a portfolio. This makes everything discoverable, shareable, and composable.

AI Reduces Operational Overhead: Across all scenarios, AI Agents handle matching, synthesis, scheduling, reporting, and distribution — cutting admin time by 40–70%.

Event-Driven Automation: The Event Bus enables zero-touch automation between modules: a funded campaign automatically triggers stake distribution; a completed process fires outcome recording.

Works at Every Scale: The same platform architecture serves a solo freelancer, a 120-person open-source community, and a 200-person enterprise — with no configuration changes.

Full Lifecycle Coverage: Kogi covers the complete arc: ideation → planning → execution → delivery → economics → iteration. No external tools required.
